The CDNA library to be analyzed within the framework of this project was created using a Bortytis chnerea strain which was grown under conditions of nitrogen deprivation, which is the normal situation for B. cinerea during its development on its host plant.
The library was produced in an oriented direction, in the pBSII
                                                                                                                                                                                                                                                                                                                                                                                                        Eukaryota; rungi; Ascomycota; Euascomycetes; Discomycetes; Leotiales; Sclerotiniaceae; Botryotinia.

stored on computer readable medium and used in the production of
anti-S.aureus vaccines
Claim 1; Page 1600-1601; 3271pp; English.
Claim 2; Page 1600-1601; 3271pp; English.
Claim 3; Page 1600-1601; 3271pp; English.
Claim 3; Page 1600-1601; 3271pp; English.
Claim 4; Proferably selected from a floppy or hard disk, random access memory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are be used in a vaccine composition against 5 aureus infection of be used in a vaccine composition against 5 aureus infection of composition against 5 aureus infection of composition and succined skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides of and their fragments) are useful as primers or probes for isolating composition and production of the polypeptides of any of the S.aureus DNA sequences contained on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         IncontintyQualifiers

New isolated Borrelia burgdorferi nucleic acids - used to develop products for the detection, diagnosis, characterisation, prevention and therapy of infections, particularly Lyme disease claim 1: Page 1037-1039; 1128pp; English.

X20248 to X20402 represent polynucleotide sequences isolated from Borrelia burgdorfer! (Bb). Products derived from Bb can be used for the detection, diagnosis, characterisation, prevention and therapy of Bb infections, e.g. Lyme disease. They can also be used for the production of blosynthetic products, e.g. enzymes. Borrelia belongs to a family of motile, spiral-shaped bacteria called Spirochetes. Spirochetes are pathogenic in humans and Borrelia causes epidemic and endance relapsing fever, and Lyme borrelisels, more commonly known as
v4-MAY-1999 (first entry)
Borrella burgdorferi polynucleotide sequence #57.
Borrella burgdorferi; spirochete; bacterium; pathogen; Lyme disease; epidemic relapsing fever; endemic relapsing fever; infection; diagnosis; characterisation; detection; ds.
Borrella burgdorferi.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                              results with the distriction of the develop products for the disposals and treatment of e.g. This sequence represents a nucleic acid molecule which encodes a secreted thuman protein. The gene number, and the clone it is derived from, are detailed in the descriptor line. The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion of the invention relates to 28 novel genes and their fragments (nucleic acid sequences: V44277) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 28 novel genes and their fragments (nucleic acid sequences: V44273) stable v43435; amino acid sequences w7519-w7525) which are useful for preventing, treating or amilorating medical conditions are useful for preventing, treating or amilorating medical conditions or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 28 polynucleotides, based on which tissues they are most highly expressed in (see V34286 for described
                                                                                                                        Human secreted protein gene 11 clone HLTBS22.

   DNA encoding lysine-sensitive aspartokinase II - from methylotrophic, thermotolerant bacillus sp. MGA 3, for producing lysine-vorgrowducing mutants

Tysine-vorgrowducing mutants
Claim 2: Fig 2: 16pp: English.
This sequence encodes a polypeptide which corresponds to the alphabeta dimer subunit of lysine-sensitive aspartokinase II (AKII) of bacillus sp. MGA3. MGA3 is methylotrophic and thermotolerant.
C alphabeta dimer subunit of lysine-sensitive aspartokinase II (AKII) of bacillus sp. MGA3. MGA3 is methylotrophic and thermotolerant.
C The native form of AKII is an alphabeta2 terramer. This DNA sequence was identified by cloning the structural gene from a confidence was identified by cloning the structural gene from a sequence spartokinase isozymes. The open reading frame shown encodes both the alpha and beta subunits in the same reading frame. This gene may be used to produce microorganisms such as new strains of bacteria which overproduce lysine at higher levels or under more stringent environmental conditions.
Sequence 2223 BP; 702 A; 394 C; 498 G; 629 T;
/note- "Indicated in the spec. as having dyad symmetry to the region 490-513" 664.\ .1899

claim 1; Page 1461-1463; 2084pp; English.

A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for of Enterococcus faecalis in samples. They can also be used for progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the
                                                                                                                                                                                                                                             F 05-DEC-1995; J16431.

T recombinant expression of viral protein

S Example 5; Page 4-7; 10pp; Japanese.

T recombinant expression of viral protein of packouli mild mosale virus (Pakkov), and is a DNA sequence of the patchouli mild mosale virus (Pakkov), and is a DNA sequence of the invention. The coat protein of Pakkov), and is a DNA sequence of the invention. The coat protein of Pakkov, which cannot be synthesised on maturally from a plant genome, can be produced by the plant cell transformed by the DNA.

23-FPB-1999 (first entry)
Contiguous sequence determined for P. carinil from immunosuppressed rats. PCR amplification; sequencing; assay; inhibitor; nuclear rRNA gene; catalytic Group I self-splicing intron reaction; drug screening; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Screening assays for drugs against Pneumocystis carinii - based on inhibition of 26s rRNA gene intron self-splicing Example 1; Fig 2; 51pp; English.

Example 1; Fig 2; 51pp; English.

The present sequence represents the contiguous sequence determined for Pneumocystis carinii from immunosuppressed Sprague-Dawley rats, using the in vitro method of the invention. The method assays for an inhibitor of the catalytic Group I self-splicing intron reaction in the nuclear rRNA genes of P. carinii. The method is useful for screening potential drugs for treating P. carinii infections before more costly animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  D-MAR.1999 (first entry)

    polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      from sample with PCR primers specific for the 26S rRNA gene of from sample with PCR primers specific for the 26S rRNA gene of from mamocystis cartinits cartinits cartinits.

The present sequence represents the total contiguous sequence of pneumocystis cartinit in immunosuppressed Sprague-Dawley rats. The specification describes a method for the diagnosis of Pneumocystis cartinit which comprises detecting the presence of a nucleic acid sequence containing the 26S rRNA gene specific for P. cartinit in a sample. The 26S rRNA gene in a sample is amplified, and the primer extension products detected by hybridisation with a labbled colligonucleotide. The methods can be used for the diagnosis of P. cartinit infection and for the detection of various species of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     03-SEP-1998 (first entry)
Total contiguous sequence of P. carinii in immunosuppressed rats.
Detection: diagnosis; 26S rRNA gene; P. carinii specific; infection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1176 T;

A computer readable medium has been developed which has recorded on it
A computer readable medium has been developed which has recorded on it
X12938 to X13919 represent these nucleotide sequences which are primary
nucleotide sequences, also known as contigs. The computer-based system
can identify fragments of the Enterococcus faecalis genome with
commercial importance. The products can be used to detect the presence
of Enterococcus faecalis in samples. They can also be used for
diagnosing Enterococcal infection in an animal and monitoring
modulate the growth or pathogenicity of Enterococcus faecalis, or
another related organism, in vivo or in vitro. In particular the
can be used in vaccines to prevent or attenuate an Enterococcal

Probes to the color of the content membrane protein - for produ. of recombinant polypeptide useful in vaccines, etc.

Claim 1; Column 9-10; Ilpp; English.

This sequence represents the coding sequence for a 15 kD outer membrane protein (OMP) of Haemophilus influenzae. The 15 kD OMP is conserved among type b and non-typable H.influenzae. Epitopes of the protein encoded by this sequence can be used as a standard or reagent in diagnostic tests. The protein can also be used in vaccines against type b and non-typable H.influenzae. Monoclonal antibodies directed against the encoded protein can be used as diagnostic reagents, and as the ancoded protein can be used as diagnostic reagents, and as thereapeutic agents for passive immunisation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           21-500-1996 (first entry)
Haemophilus influenzae 15 kD outer membrane protein coding sequence.
Outer membrane protein; immunoreactive; OMP; type b H.influenzae;
non-typable H.influenzae; murine monoclonal antibody; vaccine; therapy;
passive immunisation; ss.
which codes for amino acids 140-254 of the Plasmodium falciparum antigen MSA I. The obtd. fragment is used in the construction of hybrid antigen SERP/MSAI/HRPIT which can be used in anti-malarial vaccines which have a significantly stronger protective effect than those using individual proteins. The vaccines are also easier to purify and are less likely to be rendered ineffective by a mutation of the pathogen. See Q26061.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /*tag= a

                                                                                                                                                                                                                                                                                                                                                                New bovine histamine HI receptor - used for treating allergy Claim 2; Fig 1-5; 11pp; Japanese.
Claim 2; Fig 1-5; 11pp; Japanese.
This sequence encodes bovine histamine HI receptor. This sequence can be used in the construction of the expression vectors, pBHI or pEF-BOS-HI. These vectors may be use to transform E. coli, such that they produce the HI receptor protein. The histamine HI receptor may be used for the treatment of allergy.

An enzyme with specificity for cholecystokinin (CCK) substrates

(specifically the non-sulphated CCKB and the CCKS peptides) was

c purified from rat cerebral cortex membranes using high performance

1 quid chromatography. Based on amino acid sequence data from the

purified enzyme, PCR primars were designed to amplify oligonucleotide

purified enzyme, PCR primars were designed to amplify oligonucleotide

purified enzyme, PCR primars were designed to amplify oligonucleotide

probes A and B of lengths 350 and 380 nucleotides, respectively.

Using these probes, two distinct clones were identified in a rat

brain cDNA library. The first clone had the present sequence and

is the rodent homologue of human tripeptidylepetidase II. The

second clone (see T72653) differed in the 5' region, probably as a

result of alternative splicing, and appears to be a serine

ectopeptidase. The rat enzymes are preferred for use in a new

method of screening for medicaments for treating disorders linked

to the inactivation or degradation) of endogenous neuropeptides. In the

method, a candidate molecule is contacted with a membrane tripeptidyl-
                                                                                                                                                                                                                                              Screening medicaments for treating disorders linked to inactivation of endogenous neuro:peptide(s) - by contacting candidate molecule with membrane tri:peptidyl-peptidase (homologue) and measuring enzyme activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    peptidase or homologue, and enzyme activity is measured.

Blosorders linked to inactivation or degradation of endogenous neuropeptides, include food intake disorders, cognitive and motor disorders such as anorexia, schizophrenia, Parkinson's disease and depression, as well as gastrointestinal transit disorders such as irritable bowel syndrome, bulimia and pathological obesity.

Claim 1; Page 101-103; 278pp; English.

CDNA sequences encoding UNC-53 protein 8A and 7A variants of C. elegans are new. The UNC-53 proteins and nucleic acids are useful as medicaments to promote neuronal regeneration, revascularisation or wound healing, or for treatment of chronic neurodegenerative diseases (e.g. Alzheimer's or Huntingdon's disease) or acute tranmatic injuries. Transgenic cells and organisms transfected with UNC-53 cDNA can be used to determine whether a substance is an inhibitor or enhancer of the regulation of cell shape or motility or the direction of cell migration by screening for a phenotypic change in the cell. Inhibitors can be used to alleviate the spread of disease inducing cells or metastasis. Probes derived from the CDNA sequences can be used to identify proteins which are active in the signal transduction pathway that can be used as

It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in the treatment of autoimmune diseases. Peptides using the D-form amino acids are more effective immunomodulators than their diastereomers or enantlomers. Sequence 6 AA; |

New immunomodulating dimer peptide(s) - based on a Class I HLA-B

PT alpha-1 domain, used for preventing rejection of transplants or

treating autoimmune diseases

S Claim 15; Page 35; 41pp; English.

C This sequence represents a specifically claimed peptide which forms part

of the immunomodulating dimer peptides of the invention. A peptide-type

c compound or variant is claimed which has immunomodulating activity,

or the immunomodulating dimer peptides of the invention. A peptide-type

c compound or variant is claimed which has immunomodulating activity,

or variant is claimed which has immunomodulating activity,

c comprises the formula; A-B, where A, B = (R aa76-77L) (aa79-84) or

c caterified forms of up to 60 amino acids, where the peptide-type compound

c comprises the formula; A-B, where A, B = (R aa76-77L) (aa79-84) or

c case17-768; aa76 = E or V; aa77 = D, S or N; aa79 = R C

c case3 = G or N; and aa represents amino acid; aa82 = R

c or L; aa83 = G or R; and aa represents amino acid; as82 = R

c or L; aa83 = G or R; and aa represents amino acid; as82 = R

c or L; aa83 = G or N; and aa represents amino acid; as82 = C

c or Lisas I HLA-B alphal domain (positions 79-84). They can be used to

nihibit cytotoxic T-lymphocytes (CTL) from undesirably attacking calls in

c a host or in vitro. They can also be used in combination with antiqenic

c peptides or proteins of interest to activate CTLS. They can also inhibit

c the proliferation of T cells in response to anti-CD3. They can be used be

controlled to the peptides or proteins of interest to activate of the peptides or automin to a treating autolimmune

c challed the automin of treating of treating and autolimmune

controlled the control of treating and autominity of treating autolimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel immunomodulatory peptide-type compound - useful for inhibiting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 10. Page 36. 41pp, English.

The present sequence is an immunomodulatory peptide, which comprises a Class I HiA-B alpha-1 domain sequence. It can be used in a pharmaceutical composition together with a subtherapeutic dose of an immunosuppressant, to extend the period of acceptance of a transplant from a major histocompatibility complex (MHC) unmatched donor, i.e. to inhibit transplant rejection. It can also be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Location/Qualiflers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          transplant rejection

Claim 10; page 36; 41pp; English.

The present sequence is an immunomodulatory peptide, which

comprises a Class I HiA-B alpha-1 domain sequence. It can be used
in a pharmaceutical composition together with a subtherapeutic dose
of an immunosuppressant, to extend the period of acceptance of a

transplant from a major histocompatibility complex (MHC) unmatched
donor, i.e. to inhibit transplant rejection. It can also be used in
                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ő

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence
```

```
This is the amino acid sequence of a near full-length corn threonine deaminase, as deduced from a coun close (see x07180), threonine deaminase, as deduced from a coun endosperm CDNA clone (see x07180), designated cenl.pk0064 f4, obtained from a corn endosperm CDNA.

Ibrary. The amino acid sequence shows similarity to the Burkholderia capacia enzyme. The invention relates to new isolated nucleic acid fragments (see x07186 98) encoding plant enzymes (see x07186) encoding plant enzymes (see x0776 98) encoding plant enzymes (see x07777-44) that catalyse steps in the biosynthesis of lysine, threonine, methionine, cysteine and isolated from aspartate, the enzyme being selected from dihydropicolinate reductase, diaminopimelate epimerase, threonine synthese, threonine deaminase or S-adenosymethionine synthetase. The invention also relates to the construction of a chimeric gene encoding all or a portion of the biosynthetic pathway enzyme, in sense or antisense orientation, where expression of the enzyme in a transformed host cell. Overexpression or reduction of expression of genes encoding the amino acids in human food and animal feed. Transformed host cells can acids in human food and animal feed. Transformed host cells can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             to identify compounds that inhibit one of the enzymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New plant amino acid biosynthetic enzymes, DNA and chimeric genes encode: dihydropicolinate reductase; diaminopimelate epimerase; threonine synthase; threonine deaminase; S-adenosylmethionine

                                                                                                            The present sequence and prevent bacterial infections e.g. S. aureus and diagnose, treat and prevent bacterial infections e.g. S. aureus and diagnose, treat and prevent bacterial infections e.g. S. aureus and diagnose, treat cancers, ulcers and gastritis
Claim 1: Page 6: 43pp: English.
C. The present sequence represents a partial gidAl protein of Staphylococcus aureus. GidAl proteins, nucleic acids and agonists are used to treat conditions requiring increased activity or expression of gidAl, while conditions (particularly bacterial infections) requiring inhibition of gidAl are treated by administering an antagonist, inhibition of gidAl are treated by administering an antagonist.
C. inhibition of gidAl are infection, particularly meningitis and also Helicobacter pylori infections e.g. related cancers, ulcers and cast in-dwelling devices to prevent infection or generally as wound treatments to prevent adhesion of bacteria to matrix proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence was deduced from DNA sequence obtd. from plasmid p53A, a subclone of a DNA library prepd. from genomic DNA of S.thermotolerans. The 3-acylation enzyme is involved in the synthesis of macrolide antibiotics. Microorganisms, ep. Streptomyces, transformed with the gene can be used for the commercial prodn. of macrolide antibiotics, e.g. 3-acylated tylosin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gene encoding 3-acylation enzyme for macrolide antibiotics - used to transform Streptomyces sp. to have acylation activity, for use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

from Bacillus thuringiensis ser. jegathesan 367 (Bfjeg367); it is a crystal torin to find. Wt. 80 kD which is active against dipteran insects, esp. mosquitces. The full-length, recombinant DEG80 toxin, had mean LC50 values (in ng/ml) after 48 hours of 18.8, 42.7 and 10.1 against larvae of Aedes agapyti. Anopheles stephensi and Culex pipiens, respectively. Wild-type Btjeg367 crystals gave values of 47.4, 54.5 and 9.6. The JEG80 protein is far more toxic (6-40 times more toxic against the mosquito species tested) than the Bt CryIVD toxin, despite their close sequence similarity.
                                                                                                                                                                                 Bacillus thuringiensis insecticidal protein JEG80.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated gidal polypeptide from Staphylococcus aureus - used to diagnose, treat and prevent bacterial infections e.g. S. aureus and diagnose, treat and prevent bacterial infections e.g. S. aureus and diagnose, treat and prevent bacteris, ulcers and gastritis

Claim 1: Page 4-5: 43pp: English.

The present sequence represents a gidal protein of Staphylococcus aureus. Gidal proteins, nucleic acids and agonists are used to treat conditions requiring increased activity or expression of gidal, while conditions (particularly bacterial infections) requiring inhibitory nucleic acid or competitive polypeptide. The products are used to treat S. pneumoniae infection, particularly meningits and side these antibacterial infections e.g. related cancers, ulcers and gastritis. These antibacterial agents may also be used to treat in-dwelling devices to prevent infection or generally as wound treatments to prevent adhesion of bacteria to matrix proteins.
                                                                                               Example: Page 45-47; 77pp; English

This N-succinyl-L-diaminopimelic acid desuccinylase is encoded by
This N-succinyl-L-diaminopimelic acid desuccinylase is encoded by
This N-succinyl-L-diaminopimelic acid desuccinylase is encoded by
the newly isolated dapE gene (see V42319 and V4232) of
Helicobacter pylori strain 60190. It shows 37.9% identity and
(1.0% similarity with the DapE protein of E. coli. Conditionally
lethal dapE- mutant H. pylori strains are provided; a claimed dapE-
mutant is deposited as ATCC 55897. Such mutants can be used in a
claimed method of immunising a subject against H. pylori infection.
The dapE- mutants can also be used as hosts of nucleic acids
encoding foreign proteins. Such mutants can be used in claimed
methods of immunising against bacterial, viral, fungal or parasite
infections. Sperm antigens may also be expressed for use in birth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                25-MAR-1999 (first entry)

Claim 10; Page 54-56; 73pp; English.

The NWD2 gene (T31993) is named after its role in the Nonsense-Mediated mRNA Decay pathway. The protein, Nmd2p, binds to Upflp.

A C-terminal fragment of the protein (T31994) also binds to Upflp and, when overexpressed in the host cell, the fragment inhibits the function of Upflp, thereby inhibiting the nonsense-mediated

Polynucleotide sequences encoding new proto:cadherins - useful for modulating natural binding and regulating activities.
Example: Page 63; 114pp; English.
Two regions of conserved AA sequence, one from the middle of the third cadherin extracellular subdomain (EC-3) and the other from the C-terminus of the fourth extracellular subdomain (EC-4) were identified. The corresp. degenerate oligos (Q68949, Q68950) were

Claim 8: Page 49-52; 73pp; English.

The NWD2 gene (T31993) is named after its role in the Nonsense-Mediated mRNA Decay pathway. The protein, NMd2p, binds to Upflp, when overexpressed in the host cell, the fragment inhibits the function of Upflp, thereby inhibiting the nonsense-mediated mRNA decay pathway.

Sequence 1089 AA;

PP Polynucleotide(s) encoding human protocadherins pc3 and pc4 and rat pc1, nucleotide(s) encoding human protocadherins pc5 - involved in cell-cell adhesion and regulation activities

Example 2; Page 67-68; 146pp; English.

R87142-R87144 represent partial fragments of the drosophila protocadherin consequence. The CDNAs encoding these sequences were isolated after consequences. The primers were constructed from portions of the in T03575 and T03576. The primers were constructed from portions of the canno acid sequences of the third and fourth extracellular domains of published cadherin sequences. The cytoplasmic domain of cadherin catherins and other cytoskeleton through catenins and other cytoskeleton associated proteins. The cytoplasmic domain is not present in all cadherins, but in those which possess it, it is essential for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  29-AUG-1996 (first entry)
Protocadherin clone DROSOPHILA-12.
Protocadherin; pc3; pc4; pc5; human; rat; cadherin; cell adhesion; mouse; catenin; therapy; clone; frog; fruit fly.
designed for use as PCR primers. PCR was carried out on a rat brain cDNA prepn. Two major bands of about 450 bps and 130 bps were found. The 450 bp band corresponded to the expected length between the two primer sites, but the 130 bp band could not be predicted from any of the previously identified cadherin sequences. The 450 bp and 130 cf the previously identified cadherin sequences. The 450 bp and 130 clones were extracted and sequenced. Nineteen novel partial cDNA clones were isolated. The DNA and deduced AA sequences of the clones (including sequences corresp. to the PCR primers) are given in 068951-068969 and R58860-R58978. Various cDNA fragments structurally similar to the rat cDNAs were isolated from human, mouse and Xenopus brain cDNA prepns. and from Drosophila and c. elegans whole body cDNA prepns. by PCR using the above primers. The DNA and deduced AA sequences of the resulting PCR fragments (including sequences corresp. to the PCR primers) are given in 068971, Q68972-Q68994 and R58882-R58905 and R49143. Comparison cf the deduced AA sequences indicates a similarity, in particular, there are three sets of clones that appear to be cross-species commons. The DNA mouses: RAT-218, MOUSE-322 and HUMAN-43; RAT-314, MOUSE-321 and HUMAN-11; and MOUSE-322 and HUMAN-43; RAT-314, MOUSE-321 and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               89.7%; Score 26; DB 1; Length 43; 83.3%; Pred. ö
cadherins adhesive function. The cadherins which do not possess a cytoplasmic domain appear to function via a different method from those with a cytoplasmic domain. These protein sequences are involved in cell-cell adhesion. These sequences may have regulatory functions in the cell, as well as the cell-cell adhesive properties. Antibodies produced against these sequences are useful for modulating the binding activity of these protocadherins, and can be used therapeutically.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a purified rat pro-hormone convertase, designated PC7. PC7 is a member of the subtilisin-kexin protein family, it is widely distributed (especially in lymphoid tissue) and is a possible maturation enzyme for gp160 in target CD4+ cells. Since PC7 has been found in many brains of patients with Alzheimer's disease and
                                                                                                                                                                                                                                                                                                                                                                        Rat spleen pro-hormone convertase 7.
PC7: HIV gpl60; human immunodeficiency virus; Alzhelmer's disease;
Down's syndrome; AIDS; inhibitor; antibody; subtilisin-kexin protein;
lymphoid tissue; CD4+ cell; rat; human.
Rattus rattus.

```

```
CC also contemplated that over-expression of PC7 may protect against the disease. Antibodies against PC7 are used to detect/quantify PC7 in cells and tissues, and oligonucleotides able to hybridise to a PC7 coding sequence, are used similarly at the nucleic acid (especially CC mRNA) lavel. Oligonucleotides can also be used to amplify PC7-encoding convert precursors to mature proteins, especially HIV gp160 to CC mRNA) lavel. Oligonucleotides or vectors expressing them, are used to prevent expression of PC7 in cells susceptible to HIV CC infection; they prevent expression of PC7 in cells susceptible to HIV CC infection to AIDS.

replication licensing factor MCM5 - fission yeast (Schizosaccharomyces pombe)
N;Alternate names: cell division control protein CDC46; cell division control protein C;Species: Schizosaccharomyces pombe
C;Species: Schizosaccharomyces pombe
C;Date: 13-Aug-1999 #sequence_revision 13-Aug-1999 #text_change 13-Aug-1999
C;Accession: A48723
R;Miyase, S:,Okishio, N:; Samejima, I:; Hiraoka, Y:; Toda, T:; Saitoh, I:; Yanagida, Mol. Biol. Cell 4, 1003-1015, 1993
A;Title: Fission yeast genes ndal(+) and nda4(+), mutations of which lead to S-phase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             A) Description: part of the replication licensing system that permits DNA replication C; Superfamily: replication licensing factor MCM5; MCM homology C; Reywords: cell cycle control; DNA replication initiation; nucleus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  R; Politz, O.; Krah, M.; Borriess, R. submitted to the EMBL Data Library, February 1998

A:Title: A genetic screen identifies cellular factors involved in retroviral -1 frameshials Reference number: S64648; MUID:95327692
NWD2 protein - yeast (Saccharomyces cerevisiae)

N;Alternate names: IFS1 protein; protein YHR077c

C;Species: Saccharomyces cerevisiae

C;Date: 28-Oct-1994 #sequence_revision 10-Feb-1995 #text_change 06-Feb-1998

C;Accession: S48244; S46815; S64648; S64738

R;He, F; Jacobson, A

submitted to the EMBL Data Library, September 1994

A;Description: Identification of a novel component of the nonsense-mediated mRNA decay |
